New York, 30/01 January 2017

SpeechWare and its US distributor **SR Microphones** jointly announce the availability of **PhraseWizard**, exclusively licensed to End-users of speech recognition systems. Please check:

- <https://www.tablemike.com/applications/>
- <https://www.youtube.com/watch?v=HnpSpT9acos&feature=youtu.be> (teaser video)

According to the webpage above:

*“**PhraseWizard** is the ultimate tool for speech recognition vocabulary customization and a superior user experience or language use analysis. It allows lightning fast processing of a virtually unlimited number of documents, web pages and sub-web pages for: (1) cleanup (of tags, frequent typos, names and addresses, etc.), as well as (2) extraction of “phrases” with proper capitalization, abbreviations, acronyms, hyphenations and virtually any other complex word (with customized RegEx); according to the preferences or needs of each user.”*

In fact, *Dragon NaturallySpeaking* is only able to scan local *txt* or *Word* documents (with the same version of the application that generated them) for new words; **PhraseWizard** for capitalized expressions, acronyms, abbreviations and hyphenated words and even without having *Word* installed (!). Besides it is also able to clean them up as well as process *html* files, locally or in the web, to facilitate their subsequent *Dragon* analysis with the “Learn from specific documents...” functionality.

In another words, what this piece of software allows you to do is to scan a virtually unlimited number of documents such as text files, *Word* documents and even online web pages and local *html* documents (!) to quickly create a powerful *Dragon* or *Windows Speech* custom vocabulary which can include a mixture of individual words, phrases with capitalisation, acronyms, abbreviations and hyphenations; the typical obstacles for top-class accuracy --whose improper handling discourage so many existing and potential users of speech recognition. The more technical your user vocabulary, the most useful *Phrase Wizard* will be for you. Besides, the application might be quite useful for users of speech recognition systems in other languages other than English, where the speech models might not be so fine-tuned or accurate...

Users of *Dragon NaturallySpeaking* (or *Windows Speech*) know full well that extensive custom vocabulary is a key to achieving high word recognition accuracy. For example, if you are a Building Surveyor, a standard ‘out of the box’ vocabulary will not have many of the surveying terms that you work with on a daily basis. Or you might be a Teacher or Lecturer specialising in a specific academic subject and again, *Dragon* may not have as extensive a vocabulary as you would like. With **PhraseWizard**, you can very quickly create a large and extensive wordlist, for your own use and purpose, with many written/spoken forms included for import into *Dragon* based on words and phrases relative to your individual field of work!

PhraseWizard is available in two (2) licenses:

- The Demo version, which can be downloaded and tested for free and even without registration
- The “Single End-user” economic license for up to five (5) full working sessions (cleanup of data and saving of “phrases”), only when you decide to keep or save the results.

Below are a couple of screen captures of the **PhraseWizard** interface to give an idea of the amazing power of the application exclusively for End-users of speech recognition systems:

Cleaning up data

Automatic Find & Collect of "Phrases" or terms
